

## CTEC 121 - Final

Project details: This program will be a MadLibs program, meaning it will retrieve words from a user and input them into a story line. In particular this program will capitalize on being both intuitive to use as well as fool proof. The program will still work even if the user enters strange words.

Meeting requirements:

Specifications: I displayed an understanding of the structure theorem fully, use of one or more Python libraries was met by using "rindint" from the "random" library. I also thoroughly used loops, arrays/lists, functions in abundance, all of which contributed to code that very modular and efficient. I even write the story to an external file!

Presentation: As I worked on this program I documented each step, my thoughts and the approach to follow after each step. This will be what I share with you in my presentation.

Expect to see...

- My expectations and ideologies entering that project
- The issues I encountered
- My understanding of what I created
- Plenty of screen shots
- A fun program to play with!
